    Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          seq length:

The plastid ribosomal proteins. Identification of all the proteins the 50 s subunit of an organelle ribosome (chioroplast).";

J. Biol. Chem. 275:28466-28482(2000).

1. FONCTION: THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA.

1. SUBCLELULAR LOCATION: CHIOROPLAST.

1. TISSUE SPECIFICITY: EXPRESSED IN ALL PLANT TISSUES.

1. HISCELLANCOUS: ON THE 2D-GEL ITS MW IS: 16.5 KDA.

1. SIMILARITY: BELONGS TO THE 10P FAMILY OF RIBOSOMAL PROTEINS.

1. THEOPO: IPRO0190; RIBOSOMAL_L10.

1. PROSITE: PS00109; RIBOSOMAL_L10; PARTIAL.

1. PROSITE: PS01109; RIBOSOMAL_L10; PARTIAL.

Sequences AAY40727-Y40748 are functionally equivalent derivatives of the CS 4 peptide (AAY40607) which forms part of a scaffold protein. S4 is a CC beta strand peptide which forms part of a beta sheet. Peptides CC (AAY40601-Y40609) together form a single-chain scaffold protein which CC contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 6 beta-strands. The scaffold protein is constructed CC of beta strands S1-S6, and may also include beta strands A1-A3, or any CC functionally equivalent derivative of these sequences. The beta strands CC the next by hydrogen bonds, which generate a beta sandwich architecture. CC If the additional beta strands A1-A3 are included in the structures the saffold is constructed of two beta sheets, with the structure the CC saffold is constructed of two beta sheets, with the structure cc A1/S1/S4/S3 and S6/S5/S2/A2/A3. The beta strands are connected to other via mainto acid loops, where at least one of the loops binds to a creeptor or antigen. The scaffold protein is used to stabilize antigens CC or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold CC may be bound to a protein which binds to a tumour antigen. This will CC target the complex to tumour cells. Another surface may be bound to a cytotoxic molecule or an aucoimmane antibody which may then kill the CC tumour cells and peptides in a peptide library and may be used to constabilize individual peptides in a peptide library and may be used in CC disannestic techniques. And to stabilize antigens is stabilize antigens. And to stabilize antigens is a varcines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

          Sequences AAY40727-Y40748 are functionally equivalent derivatives of the CC S4 peptide (AAY40607) which forms part of a scaffold protein. S4 is a CC beta strand peptide which forms part of a beta sheet, peptides (CC cantains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 6 beta-strands. The scaffold protein is constructed cf functionally equivalent derivative of these sequences. The beta strands S1-S6, and may also include beta strands A1-A3, or any CC functionally equivalent derivative of these sequences. The beta strands connected to the next by hydrogen bonds, which generate a beta sandwich architecture. CC if the additional beta strands A1-A3 are included in the structure the scaffold is constructed of two beta sheets, with the structure the CC A1/S1/S4/S3 and S6/SS/S2 W16 beta strands are connected to each other via amino acld loops, where at least one of the loops binds to a tother via amino acld loops, where at least one of the loops binds to a construct as scaffold protein is used to stabilize antigens or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold cC may be bound to a protein which binds to a tumour antigen. This will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                x22222222

These scaffold proteins can be used as a scaffold to bind antigen- or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AAR29309-B39939 were used in the proteins of the invention.

Another surface may be bound to a cytotoxic molecule or an autoimmune antibody which may then kill the tumour cells. Therefore the scaffold protein may be used to target chemotherapeutic agents to specific cells. It may also be used to stabilize individual peptides in a peptide library and may be used in diagnostic techniques, and to stabilize antigens used as vaccines.
                                                                                                                                                                                                                                                              The present invention is concerned with producing scaffold proteins based upon the human CTLA-4 SCA domain. These scaffold proteins can used as a scaffold to bind antigen or receptor binding fragments. The used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osterossis, rheumatoid arthritis and diabetic retinopathy. Sequences ANB29930 res2939 were used in the production of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

                                                                                                                                                    Sequences AAX40727-Y40748 are functionally equivalent derivatives of the CC S4 peptide (AAX40607) which forms part of a scaffold protein. S4 is a CC beta strand peptides which forms part of a scaffold protein which CC contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 1 disulfide bond, contains less than 10% alpha helix CC and contains at least 1 for the strands. The scaffold protein is constructed CC in the strands S1-56, and may also include beta strands A1-A3, or any CC functionally equivalent derivative of these sequences. The beta strands CC form two beta sheets $1/$4/$3 and $5/$5/$2 with each strand connected to CC if the next by hydrogen bonds, which generate a beta sandwich architecture. CC If the additional beta strands A1-A3 are included in the structure the coaffold is constructed of two beta sheets, with the structure the CC A1/$1/$4/$3 and $5/$5/$2/$2/$2/$3. The beta strands are connected to each cother via amino acid loops, where at least one of the loops binds to a receptor or antigen. The scaffold protein is used to stabilize antigens CC or whole proteins such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface of the scaffold may be bound to a protein which binds to a tumour relia. Therefore the scaffold protein may be used to stabilize individual specific cells. It may also be used to stabilize individual specifies in a peptide library and may be used in CC diagnostic techniques, and to stabilize antigens used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY40736

These scaffold proteins can be used as a scaffold to bind antigen- or receptor-binding fragments. These can be used in the treatment of diseases such as cancer, atherosclerosis, thrombosis, osteoporosis, rhematoid arthritis and diabetic retinopathy. Sequences AMR29930-189939 were used in the production of the proteins of the invention.

CC 54 peptide (AAY40607) Which forms part of a scaffold protein. S4 is a CC (AAY40607) together form a single-chain scaffold protein which CC (AAY40601-Y40609) together form a single-chain scaffold protein which CC contains at least 6 beta-strands. The scaffold protein which CC cand contains at least 6 beta-strands. The scaffold protein is constructed CC of beta strands S1-S6, and may also include beta strands A1-A3 or any CC functionally equivalent derivative of these sequences. The beta strands CC form two beta sheets S1-S4/S3 and S6/S5/S2 with each strand connected to the next by hydrogen bonds, which generate a beta sandwich architecture. CC if the additional beta strands A1-A3 are included in the structure the csaffold is constructed of two beta sheets, with the structures to the via amino acid loops, where at least one of the sconected to each correspond to each scaffold protein is used to stabilize antigens CC or whole protein such as receptors, or their fragments. It may be used to bind two separate molecules. For example, one surface may be bound to a protein which binds to a tumour antigen. This will crarget the complex to tumour cells. Another surface may be bound to a contein which binds to a tumour antigen the current conteins cells. Another surface may be bound to a contein which binds to a tumour antigen the complex to tumour cells. Therefore the scaffold protein may be used to target the condition appetitic agents to specific cells. It may also be used to stabilize individual peptides in a peptide ilbrary and may be used to catabilize individual peptides in a peptide antigens used as vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

These scaffold proteins can be used as a scaffold to bind antigen or receptor binding fragments. These can be used in the treatment of diseases such as cancer, atherosal errosis, thrombosis, osteoporosis, rheumatoid arthritis and diabetic retinopathy. Sequences AAB29930-B29939 were used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Scaffold composed of single-chain polypeptide having beta sandwich architecture carrying new and randomized peptide sequences useful as supporting framework and carrying antigen or receptor binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              88888
CC cytotoxic lymphocyte maturation factor (CLMF) and neutralises CLMF induced proliferation by more than 50% in a CLMF and neutralises CLMF conduced proliferation by more than 50% in a CLMF dependent T cell CC growth assay and/or inhibits binding of at least 60% of the factor CC to phytohaemaygluthnin (PHA) activated peripheral blood lymphocyte (PBL) blasts as determined in a CLMF receptor binding assay. CLMF is CC a heterodimeric protein having a molecular weight band of 75 kD, attended by sodium dodecyl sulphate-polyacrylamide gel electrophoresis CC (SDS-PRAE) under non-reducing and/or reducing conditions, providing a CC subunit having a molecular weight band of 40 kD and a second condition and conditions and conditions are subunit having a molecular weight of 35 kD. The present sequence conditions from an example of the present invention. The antibody can be cused for the purification and/or detection of CLMF. It is also used in therapeutic treatments which require selective blocking of proliferation conditions and activation of cytotoxic T cells (CTLS) such as in transplantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

Peptides AAW39430-W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptides AAW39450-W39503 are proteolytic cleavage sites capable of linking together T cell epitopes in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            in a mämmal. They can also be used for treating e.g. psoriasis, arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diagnosis at in bioreactors. AAY50592 to AAY54572 represent specifically claimed peptides, and AAY546573 to AAY5443 and AAX33183 to AAX33186 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T cell epitope; immune response; human leukocyte antigen; HLA Class vaccine; humannogenic; major histocompatability complex; MHC; B cell; disease; anti-tumour; anti-viral.

                                                      The invention relates to methods for selecting and identifying a collular receptor for a virus, by immobilising, on a support, a monoclonal antibody targeted to a viral surface protein that determines the virus to the receptor. The immobilised antibody is competitive binding with recombinant commobilised antibody are eluted by competitive binding with recombinant compared to the viral surface protein. In a reverse method, the viral competitive binding with recombinant compared to the viral surface protein. In a reverse method, the viral competitive binding with recombinant compared to the viral surface protein. In a reverse method, the viral competitive binding with the peptides are compared to the viral competitive binding with the competitive binding with th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
